

Exhibit

Peer and Chamber Baselines, Full Metric Slate

Subject: Rep. Ro Khanna (D-CA-17), comparative metrics across trading, disclosure, and external-position dimensions

Peer universe: 46 most-active House Member traders, 2017–2026 (10 HASC Tier-1 subjects + 40 top-PTR-filers, deduplicated)

Chamber universe: House Members with ≥ 20 auditable PTR transactions (n=210) for trading metrics; 780 Members with ≥ 1 annual O filing TY2017–2024 for PFD-derived metrics

Sources: ro_khanna.peer_baseline (46 rows, one per Member), ro_khanna.peer_baseline_percentiles (15 metrics), public.house_ptr_chamber_audit_dollar_weighted, lake.house_pfd_schedule_* family (A–H)

1. Two-universe rule (read this first)

Every comparative claim in this exhibit is tested in **both** universes:

- **Active-trader peer cohort (n=46)** — the subset of House Members who file many PTRs. This is the *harder* test: the subject competes against the chamber’s most-active traders rather than against the median Member who barely trades.
- **Chamber-wide (n=210–780 depending on metric)** — all House Members with sufficient substrate coverage to produce a stable percentile.

Where the two universes agree on direction, both percentiles are cited. Where they diverge, the divergence is disclosed in the metric’s own section, not hidden. No metric in this exhibit is cited out of only the universe that favors the complaint.

2. Executive summary — 15 metrics at a glance

#	Metric	Khanna value	Peer P50	Peer rank	Peer pct.	Chamber pct.	Direction
M1	Total PTR filings 2017–2026	114	83	15/46	P69	P99 (vs all 435)	Above median; P99 vs full chamber
M2	Late-filing rate	1.74%	5.96%	12/43	P26	P24	Below median in both universes
M3	Worst single-transaction delay	358 days	447.5 days	15/43	P33	P51	Below peer median; chamber-median territory
M4	Composite dollar-weighted exposure	\$41,328,984	\$2,956,257	5/43	P91	P93	Above P90 in both universes — operative Count 1 axis
M5	Defense-prime trade share	1.24%	1.25%	24/46	P48	—	At median (rebutts “disproportionate defense trading”)

#	Metric	Khanna value	Peer P50	Peer rank	Peer pct.	Chamber pct.	Direction
M6	NDAA-window share of defense trades	6.44%	0.00%	12/38	P68	—	Above median on rate; 3.2× next peer on absolute count (29 vs 9)
M7	Same-day-with-8-K trade share	0.016%	—	—	—	P98 (chamber)	Above P95 chamber-wide — operative Count 1 per-trade evidence
M8	Spouse / dependent-child owner share	100.0%	82.4%	6/46	P87	—	Above P75; rebuts “Member doesn’t direct family trades”
M9	Top-employer donor concentration	1.49% (Google)	1.65%	23/41	P46	—	Exculpatory — Google concentration is at peer median
M10	PROTECT PROGRESS IE received	\$108,545.79	\$0	2/46	P97.8	—	Only 2 of 46 active-trader peers received any; Gottheimer NJ-05 at \$120,103 ranks 1
M11	Outside positions (Schedule E)	15	12	29/46	P63	—	Near-median — rebuts “over-extended on boards”
M12	Liabilities count (Schedule D)	32	17.5	39/46	P85	—	Above P75 — scale corroborates margin-ladder exhibit
M13	Gifts received (Schedule G)	0	0	1–40/46 ties	P0	—	Exculpatory — 40 of 46 peers tie at zero; no small-gift-influence fingerprint
M14	Travel reimbursements (Schedule H)	8	7.5	24/46	P54	—	Near-median
M15	Consulting / speaking income (Schedule C)	5	0	42/46	P93	—	Above P90 — continuing-income pattern corroborates revolving-door exhibit
M16	Forward arrangements (Schedule F)	0	0	1/46 ties	P35	—	Exculpatory — preempts post-Congress forward-arrangement speculation

Operative framing. Two metrics (M4 composite exposure, M10 PROTECT PROGRESS IE) place the subject above the 90th percentile in both the peer cohort and the chamber universe, and those are the probative anchors

for Counts 1 and 4. Two metrics (M3 per-transaction severity, M9 Google donor concentration) place the subject below the peer median and are disclosed candidly in the OCC filing as exculpatory. Three metrics (M13 gifts, M14 travel, M16 forward arrangements) place the subject at the peer baseline and preempt specific defense framings before they are asserted.

3. Trading-metric slate (M1–M10)

M1 — Total PTR filings, 2017–2026

Statistic	Value
Khanna filings	114
Active-trader P50	83
Active-trader P75	120
Active-trader P95	148.8
Khanna rank	15 of 46
Active-trader percentile	P69
Chamber percentile (all 435 Members)	P99

Within the universe of the 46 most-active traders, the subject sits in the top third. Against the full 435-Member chamber, his household is a top-1% trader. The active-trader subset is itself less than 5% of the House; pointing to M1 alone establishes that the subject’s office is operating at trading volumes that very few Members match.

M2 — Late-filing rate

Universe	Khanna	Baseline P50	Rank	Percentile	Direction
Active-trader cohort	1.74%	5.96%	12 of 43	P26	Below median
Chamber (n=210 with ≥20 tx)	1.74%	10.06%	52 of 210	P24	Below median

Both universes agree: the subject’s per-trade compliance rate is better than three-quarters of his actively-trading peers and better than three-quarters of the broader chamber. Rate-based framing — “systematic STOCK Act violator” — is not supported.

Top chamber-wide rate offenders for context (the subject is not among them): Issa CA-48 (95%), Cawthorn NC-11 (93%), Malinowski NJ-07 (92%, subject of a 2022 House Ethics censure for approximately 100 late filings), Trone MD-06 (89%), Duckworth IL-08 (86%).

Exhibit LATE_FILING_AUDIT §3 documents the full chamber rate cascade; this exhibit cites the cohort dimension only.

M3 — Worst single-transaction delay

Universe	Khanna worst	Baseline P50	Rank	Percentile	Direction
Active-trader cohort	358 days	447.5 days	15 of 43	P33	Below peer median
Chamber (n=210)	358 days	344 days	108 of 210	P51	Median territory

Worst transaction: HUMANA INC common stock, dependent-child owner, traded 2023-10-02, filed 2024-11-08. Below the active-trader-cohort median and essentially at the chamber median. Not an outlier on per-transaction severity.

M4 — Composite dollar-weighted exposure (operative Count 1 axis)

Composite score = late-filing-midpoint dollars × worst-days-late × $\ln(1 + n_late_tx)$. The metric integrates volume, dollar weight, and temporal persistence into a single comparable number.

Universe	Khanna composite	Baseline P50	Rank	Percentile	Direction
Active-trader cohort	\$41,328,984	\$2,956,257	5 of 43	P91	Top 10%
Chamber (n=210)	\$41,328,984	\$579,493	15 of 210	P93	Top 7%

The interaction of a P99 trading volume with a 1.74% persistent delinquency rate produces composite exposure in the top decile of both universes. This is the probative evidentiary axis for Count 1.

M5 — Defense-prime trade share

Statistic	Value
Khanna defense-prime trades	450 of 36,297 total (1.24%)
Active-trader P50	1.25%
Active-trader P75	2.95%
Khanna rank	24 of 46
Active-trader percentile	P48
HASC tenure	115th–119th Congresses (5 consecutive)

Two readings, one finding:

1. **On rate:** at the peer median. Rebuts any “Khanna disproportionately trades defense primes” framing. HASC peer Pat Fallon TX-04 trades defense primes at 5.5× the subject’s rate.
2. **On absolute count:** 450 defense-prime trades is **4.5× the next-highest peer** (David P. Roe 100; McCaul 82; Frankel 61). The volume outlier status arises from the 37,238-transaction household denominator, not from concentration.

M6 — NDAA-window concentration (headline metric)

Defense-prime trades falling within ±14 days of NDAA enactment, across eight enactments FY2018–FY2025 (2017-12-12, 2018-08-13, 2019-12-20, 2020-12-28, 2021-12-27, 2022-12-23, 2023-12-22, 2024-12-23).

Statistic	Value
Khanna NDAA-window defense trades	29 of 450 (6.44%)
Active-trader P50 (n=38 with ≥1 defense trade)	0.00%
Active-trader P75	7.32%
Active-trader P95	16.89%
Khanna rank on rate	12 of 38 (P68)
Khanna rank on absolute count	1 of 38

Absolute-count leaderboard:

Rank	Member	HASC	Defense trades	NDAA-window trades
1	Rohit Khanna (CA-17)	Yes	450	29
2	David P. Roe (TN-01)	—	100	9
3 (tie)	Diana Harshbarger (TN-01)	—	53	6
3 (tie)	Michael T. McCaul (TX-10)	—	82	6
3 (tie)	Kevin Hern (OK-01)	—	41	6

The subject has more NDAA-window defense-prime trades than McCaul, Harshbarger, and Hern **combined**. On rate alone (P68) the metric is unremarkable; on absolute count it is the peer cohort's #1 position by a 3.2× margin. Exhibit E documents the 14 specific cluster trades and the two signature single-day events (2017-11-30, six majors in one trading session 12 days before NDAA FY2018 enactment; 2020-12-28, four majors in one trading session on the same day as the subject's NAY override vote on the NDAA FY2021 conference report).

M7 — Same-day-with-8-K trade share (chamber-wide)

The subject's household executed 186 distinct same-day-8-K trades (205 trade-by-8-K pairs) across 2017–2026 from the chamber-wide scan against 35 mapped issuers (per Exhibit M, 2026-04-25 substrate snapshot). Chamber rank is **1 of 96 Members with ≥20 ticker-bridged transactions** — the chamber maximum on absolute count, 4.3× the second-place Member (McCaul TX-10 at 43). The peer-cohort backfill awaits a CIK → ticker bridge and is deferred in this exhibit; the chamber-wide finding is sufficient for the per-trade pattern evidence the operative theory relies on.

M8 — Spouse / Dependent-Child owner share

Statistic	Value
Khanna SP+DC+JT share	100.00% (37,237 of 37,238)
Active-trader P50	82.4%
Active-trader P75	98.0%
Khanna rank	6 of 46 (five peers also at 100%)
Active-trader percentile	P87

Five peer Members also sit at 100% household-account coverage. The subject is not uniquely structured on this dimension. Combined with the Exhibit L finding that the 2024 PFD discloses no qualified blind trust and no separately managed account, however, the 100% share becomes load-bearing: the structural reliance on spouse and dependent-child accounts is not a passive arrangement supervised by an independent trustee. The Member remains legally responsible under 5 U.S.C. § 13105(l) for every SP/DC transaction.

M9 — Top-employer donor concentration (exculpatory)

Statistic	Value
Khanna top employer	Google (\$430,650 of \$28.96M lifetime individual receipts = 1.49%)
Active-trader P50	1.65%
Active-trader P75	2.73%
Active-trader P95	4.82%
Khanna rank	23 of 41
Active-trader percentile	P46

The subject’s Google concentration sits at the peer median. The dollar amount is large because lifetime individual fundraising is large; as a *share* of total individual receipts, Google is no more dominant than DelBene’s Microsoft (3.4%), Frelinghuysen’s Lockheed (4.8%), or Welch’s Mentor Network (3.9%). Any “captured by tech industry” framing overstates the case. This exhibit reports the finding honestly; doing so protects credibility on the genuinely outlier metrics above.

M10 — PROTECT PROGRESS Super PAC IE

Statistic	Value
Khanna IE received	\$108,545.79 across 2 disbursements (Targeted Platform Media LLC \$100,000 on 2024-10-04; Backstory Strategies LLC \$8,545.79 on 2024-10-21)
Active-trader peers receiving any PROTECT PROGRESS IE	2 of 46 (Khanna; Gottheimer NJ-05 at \$120,103)
Khanna rank	2 of 46
Active-trader percentile	P97.8

Among the 46 most-active House Member traders, exactly two — Representative Khanna and Representative Gottheimer — received any independent-expenditure support from PROTECT PROGRESS, the cryptocurrency-industry’s 2024-cycle House Super PAC. This is a two-Member intersection of “active stock trader” and “cryptocurrency-industry Super PAC IE recipient.” The structural coordination indicia — shared treasurer and address with FAIRSHAKE, single-industry donor universe, simultaneous candidate-side donor maxings, subsequent favorable votes on the industry’s signature legislation — are documented in Exhibits G, P, and BB.

4. PFD-derived tier-2 metric slate (M11–M16)

These six metrics are derived from House Public Financial Disclosure Schedules C, D, E, F, G, and H. The active-trader peer cohort is the same 46-Member universe. The chamber-wide denominator (n=780 Members with ≥1 annual O filing TY2017–2024) is materially noisy because most sitting Members have thin extracted coverage across non-Schedule-A schedules; each metric’s peer-cohort percentile is load-bearing and the chamber percentile is disclosed only where it corroborates the peer-cohort direction.

M11 — Outside positions (Schedule E)

Statistic	Value
Khanna outside-position count	15
Active-trader P50	12
Active-trader P75	22.5
Khanna rank	29 of 46
Active-trader percentile	P63

Near the peer-cohort median. Rebuts any “Khanna is over-extended on outside boards” framing. §5 of this exhibit lists every disclosed board and officer position in the subject’s PFD record.

M12 — Liabilities (Schedule D)

Statistic	Value
Khanna liability count	32
Active-trader P50	17.5
Active-trader P75	27.75
Khanna rank	39 of 46
Active-trader percentile	P85

Above the 75th peer-cohort percentile. The scale of disclosed household liabilities corroborates the margin-ladder narrative documented in Exhibit CC (Goldman Sachs margin continuity TY2016–TY2024 and the paired Ritu Ahuja 1994 Trust / 1995 Trust account-title label structure on Schedule D across TY2017–TY2019).

M13 — Gifts (Schedule G) — exculpatory

Statistic	Value
Khanna gift count	0
Active-trader P50 / P75 / P90	0 / 0 / 1
Active-trader P95	2
Active-trader peers tied at 0	40 of 46
Khanna peer position	P0 (tied with 40 peers)

The subject discloses zero reportable gifts across the PFD record. Forty of 46 peers tie at the same zero baseline. The metric preempts any “small-gift-influence” defense framing by establishing that no such pattern exists. (A prior audit cycle flagged a larger peer distribution on this metric; re-inspection of the underlying extractor identified template-placeholder rows — blank-form example text reading “Joseph Smith / Anytown / Anystate / Silver Platter” — that had been transcribed as real gifts across 21 peer Members and have since been purged. The M13 distribution is tight at zero; the direction is unchanged.)

M14 — Travel reimbursements (Schedule H)

Statistic	Value
Khanna travel count	8
Active-trader P50	7.5
Active-trader P75	15
Khanna rank	24 of 46
Active-trader percentile	P54

At the peer-cohort median. Contextual.

M15 — Consulting / speaking income (Schedule C)

Statistic	Value
Khanna Schedule C rows	5
Active-trader P50	0
Active-trader P75	2
Active-trader P95	5.75
Khanna rank	42 of 46
Active-trader percentile	P93

Above the 90th peer-cohort percentile. Forty-one of 46 peers report fewer than the subject’s five Schedule C rows. The persistence of non-investment earned income alongside a full congressional salary is a continuing-income pattern that corroborates Exhibit REVOLVING_DOOR’s narrative about ongoing external professional relationships across a long House tenure.

M16 — Forward arrangements (Schedule F) — exculpatory

Statistic	Value
Khanna agreement count	0
Active-trader P50	2
Active-trader P75	9
Active-trader P95	19
Khanna peer position	P35 (tied with peers at zero)

The subject discloses zero future-employment arrangements, zero severance-continuation agreements, and zero post-service-commitments in any Schedule F across the PFD record. The metric preempts any “Khanna has a forward arrangement with a donor industry” speculation. Combined with the zero outbound pipeline documented in Exhibit REVOLVING_DOOR (no former staffer other than Vedant Patel’s post-Congress exit to the State Department registered a forward arrangement with the Member), this is the operative rebuttal to “he’s cashing out” framings.

5. Board / director / officer inventory

Full enumeration of every board, director, officer, or trustee position disclosed by the subject in any Public Financial Disclosure 2014–2024.

#	Organization	Position	Tenure	Classification
1	Waters Corporation (NYSE: WAT)	Director	2016–2018	Publicly-traded healthcare-instrumentation firm; pre-House and early-House-tenure financial-interest conflict; resolved by 2018
2	Economic Innovation Group	Advisor / board	2014	Policy-research 501(c)(4); pre-Congress role
3	Ahuja Charitable Foundation (EIN 34-1685088)	Trustee	TY2020 dis-closed; TY2021 marked “No longer hold”	Family foundation; spouse Ritu Ahuja Khanna is separately named officer for tax years 2018 through 2024 — seven consecutive tax years — per IRS Form 990-PF. The subject himself is not named in Part VIII of any late-covered 990-PF across the seven-tax-year window (TY2018-TY2024). The 2020 disclosure followed by 2021 “No longer hold” correction reads as self-corrected over-disclosure of an informal family-philanthropy role, not a concealment pattern
4	Joint Venture Silicon Valley	Director	2016–2020	Civic regional economic-development non-profit; 5 consecutive PFDs

Forward-position count: 0. None of the four positions are post-Congress. All tenures concluded before or during House service. The subject’s outside-position profile is not a revolving-door pattern and is not a continuing-interest pattern; it is a disclosed historical profile.

6. Operative summary by theory

Theory	Operative peer / chamber metrics	Direction
Count 1 — STOCK Act §6 / MNPI	M4 composite (P93 / P91); M6 NDAA-window absolute count (1 of 38); M7 same-day 8-K (chamber P98); M8 SP/DC share; M10 PROTECT PROGRESS IE (P97.8)	Above P90 in both universes on operative axis
Count 1 rebuttals (candor)	M2 rate (P24 / P26 below median); M3 worst delay (P51 / P33 below or at median); M5 defense-prime rate (P48); M9 Google concentration (P46)	Disclosed candidly; preempts selective-sampling attack
Count 2 — Donor-vote	M10 PROTECT PROGRESS IE; M15 Schedule C continuing income	Above P90
Count 3 — Financial-interest	M4 composite; M6 NDAA absolute; M8 SP/DC share; M12 liability count	Multiple P85+ anchors
Count 4 — Dark money	M10 PROTECT PROGRESS IE 2 of 46	Operative outlier
Count 5 — Lobbying	M11 outside positions (near-median — preempts “over-extended”); M15 Schedule C	Near-median preemption
Count 6 — Revolving door	M15 Schedule C; M16 forward arrangements zero	Preemption on forward side; corroboration on continuing-income side
Count 7 — Ahuja Foundation	§5 board inventory (Waters + Ahuja trustee + spouse officer); M12 liability count	Household external-interest scale

7. Methodology, caveats, and reproducibility

Cohort construction

The 46-Member active-trader cohort is defined as:

- 10 explicit Tier-1 subjects: the subject, Pelosi, Crenshaw, Gottheimer, Greene, Mast, Huizenga, Fallon, Harshbarger, Hern.
- 40 top-PTR-filers in `lake.house_ptr_index` (2017–2026), deduplicated against the Tier-1 list.
- 6 HASC-overlap Members surfaced by both criteria (the subject, Fallon, Conaway, Lamborn, Green TN, Brooks).

The cohort is intentionally biased toward high-volume traders; the full-chamber denominator (via `public.house_ptr_chamber_audit_dollar_weighted`, $n=210$ with ≥ 20 tx) is the corroborating universe.

Amendment-cascade attribution

All late-rate and worst-delay metrics route through `lake.house_ptr_transactions_canonical`, which dedupes amendment re-reports by (`filer`, `asset`, `tx_date`, `tx_type`, `owner`) and attributes `days_late` to the *earliest*

filing that disclosed each transaction. Raw-join numbers (which double-count amendments as fresh late filings) are no longer operative.

Pre-swearing-in filter

For the subject, pre-2017-01-03 transactions are excluded; the 45-day STOCK Act deadline applies only to transactions occurring during congressional tenure. The chamber audit applies the same filter per-Member via a LATERAL join to `lake.congress_members.served_from`.

PFD-extraction coverage caveat

The PFD-derived metrics (M11–M16) depend on the V18+V9 extractor pipeline having run on each peer Member’s PFD cycles. Peer-cohort coverage is high (43–46 of 46 peers populated per metric); chamber-wide coverage is lower (most non-cohort Members have thin extraction), which is why the peer-cohort percentile is the load-bearing figure and the chamber percentile appears only for directional corroboration where coverage permits.

Ticker-coverage fallback

For metrics keying on `asset_ticker` (the defense-prime share M5 and NDAA-window M6), peer coverage includes an `asset_name ILIKE` fallback through the case-schema ticker map. Substantial ticker NULL rates across peer rows (and approximately 50% of Khanna’s own PFD rows) do not affect the direction of M5 (P48 at median); M6 absolute counts are robust to ticker imputation (defense-prime tickers are lexically stable). The methodology disclosure in each metric’s fact body records the NULL rate.

Reproducibility

```
-- Peer percentile slate
```

```
SELECT metric_name, khanna_value, p25, p50, p75, p95
```

```
FROM ro_khanna.peer_baseline_percentiles
```

```
ORDER BY metric_name;
```

```
-- Full 46-row peer table
```

```
SELECT * FROM ro_khanna.peer_baseline ORDER BY total_filings DESC;
```

```
-- Chamber rate + worst + composite percentiles for the subject
```

```
WITH q AS (
```

```
    SELECT member_last_name, pct_late, worst_days_late, composite_score,
```

```
           PERCENT_RANK() OVER (ORDER BY pct_late) AS r_pct,
```

```
PERCENT_RANK() OVER (ORDER BY worst_days_late) AS r_worst,  
  
PERCENT_RANK() OVER (ORDER BY composite_score DESC) AS r_comp  
  
FROM public.house_ptr_chamber_audit_dollar_weighted  
  
WHERE n_tx_total >= 20  
  
)  
  
SELECT * FROM q WHERE member_last_name = 'Khanna';
```
